1. Basics

Before starting, check the existing infrastructure and define the required equipment and settings.

Various examples in this document show the different ways in which Cynap can be integrated into the network.

When connecting Cynap to LAN and WLAN at the same time, please use different IP ranges in order to prevent address conflicts.

The listed IP addresses are only examples.

Cynap can be treated as a standard network device and it is as secure as the supporting network. Cynap cannot be considered as a router, switch or firewall. Communication to other networks and access must to be controlled using your existing equipment (firewall, router, switch and so on).

By default, Cynap's second LAN port (LAN 2) is dedicated to fully integrate a WolfVision Visualizer. The behaviour of this LAN port (LAN 2) can be changed to connect Cynap to a dedicated RMS network (Room Management System) and mirroring purposes. This way, the built-in DHCP server is de-activated and a Visualizer cannot be fully integrated.

Attention:

When the second LAN port (LAN 2) is set to Visualizer Mode, never connect this LAN port for the Visualizer to your existing network infrastructure!

If this port is set to Visualizer mode, Cynap acts as DHCP-server on this port and this could cause conflicts with the existing infrastructure.

2. Glossary

This glossary will assist you in setting up the network correctly. Please note that in order to connect Cynap to an existing company network, some information from the local administrator is required.

2.1. LAN / Ethernet settings

The following settings are available for LAN 1 and also for LAN 2, when the interface mode is changed to LAN.

Priority Interface Access	The higher prioritized interface (value = 1) will be used for network service first. Ensure that the value is different from the WLAN interface priority.
DHCP	Cynap will get all network settings automatically from the DHCP server in the existing network. Switch it to OFF to set the static addresses manually.
IP address	Unique address in the network, i.e. 192.168.0.100. The IP address of Cynap can for example be set to 192.168.0.1.
Subnet mask	Available IP addresses can be limited. A commonly used subnet mask would be 255.255.255.0
Gateway	Defines the IP address of the server / connection to other networks (such as the internet). When Cynap is directly connected only to a PC, then enter the IP address of the PC.
Name server 1 / 2	Input the IP address of the preferred Domain Name System (DNS). This Server translates domain names into corresponding IP addresses.

Identity	Login credentials to connect Cynap in a protected network. (802.1x).
Anonymous Identity	The identity to be used on an unencrypted session before Identity is being validated on an encrypted session.
Authentication Method	Supported are PEAP with MSCHAPv2 and TTLS-PAP
Root Certificate	Only root certificates are supported, load the certificate by using the Web Interface through the WLAN interface. Allowed certificates: <ul style="list-style-type: none"> • root certificate (CA) with common file extension .crt Base-64-coded X.509 encoded DER certificate • Privacy Enhanced Mail with common file extension .perm Base-64-coded X.509 encoded DER certificate certificate stored between 2 tags: “---Begin Certificate---“and” --- ---End Certificate-----“

2.2. WLAN settings – access point

Channel	Defines the channel used for wireless communication. For optimum performance, select a currently unused channel.
SSID Auto	If activated, an automatic SSID is generated using the Cynap serial number
SSID Manual	Defines the network name in plain text for easy identification of the WLAN network. Following characters are supported: <ul style="list-style-type: none"> - AaBbCcDdEeFfGgHhIiJjKkLlMmNnOoPpQqRrSsTtUuVvWwXxYyZz - ÄäÖöÜü - 0123456789 - _-:.\$& ()
IP address	Defines the IP address of the access point. Cynap acts as a DHCP server and provides the necessary network settings to the connected devices.
Subnet mask	Available IP addresses can be limited. A commonly used subnet mask would be 255.255.255.0
Encryption	Defines encryption for safe network traffic. All connected devices must use the same algorithm (WPA2).
Transmit Power	Select the desired transmission power to optimize the range. The maximum power depends on selected channel and region.

Hint:

Cynap does not act as router or gateway and only serves up a “Cynap closed” network that will not connect to the internet even if the LAN port is connected to the internet.

2.3. WLAN settings – infrastructure (Cynap acts as client)

Band	By default, Cynap uses the 2.4GHz and 5 GHz frequency band. The used frequency band can be limited to either 2.4GHz or 5 GHz. This setting is available in SSID mode only.
Priority Interface Access	The higher prioritized interface (value = 1) will be used for network service first. Ensure that the value is different from the LAN interface priority.
BSSID On / Off	Toggles between SSID and BSSID mode. With BSSID (Basic Service Set Identification), the used access point will be fixed and Cynap will connect to the defined access point only. Access point hopping, which is available in SSID mode (Service Set Identification), will be prevented.
SSID	Defines the network name in plain text for easy identification of the WLAN network. Check existing WLAN infrastructure to get SSID. Following characters are supported: <ul style="list-style-type: none"> - AaBbCcDdEeFfGgHhIiJjKkLlMmNnOoPpQqRrSsTtUuVvWwXxYyZz - ÄäÖöÜü - 0123456789 - _-:.\$& ()
BSSID	Defines the network name in plain text for easy identification of the WLAN network. Check existing WLAN infrastructure to get SSID. This setting is available in SSID mode only.
Subnet mask	Available IP addresses can be limited. A commonly used subnet mask would be 255.255.255.0
Gateway IP	Defines the IP address of the server / connection to other networks (such as the internet). When Cynap is directly connected only to a PC, then enter the IP address of the PC.
Name server 1 / 2	Input the IP address of the preferred Domain Name System (DNS). This Server translates domain names into corresponding IP addresses.
Encryption	Defines encryption for safe network traffic. All connected units must use the same algorithm (None, WEP, WPA2, WPA2 Enterprise).
Identity	Login credentials to connect Cynap in a WPA Enterprise protected network.
Anonymous Identity	The identity to be used on an unencrypted session before Identity is being validated on an encrypted session.
Authentication Method	Supported are PEAP with MSCHAPv2 and TTLS-PAP
Root Certificate	Only root certificates are supported, load the certificate by using the Web Interface through the LAN interface. Allowed certificates: <ul style="list-style-type: none"> • root certificate (CA) with common file extension .crt • Base-64-coded X.509 encoded DER certificate • Privacy Enhanced Mail with common file extension .perm • Base-64-coded X.509 encoded DER certificate certificate stored between 2 tags: “---Begin Certificate---“and” ---End Certificate-----“

Signal Level Limit (dBm)	Defines when Cynap start to search for another access point with the same SSID in your infrastructure (WLAN roaming). Monitoring the current signal level to prevent too low values. Lookups could interrupt the network connection shortly and every lookup will be counted (Reconnect Counter (Low Signal Level)).
Signal Level	Shows the current strength of the WLAN signal in dBm.
Reconnect Counter (Connection Loss)	Counts every connection loss, e.g. when the selected access point would be powered down.
Reconnect Counter (Low Signal Level)	Counts every lookup then the measured signal falls below the user defined signal level limit.

2.4. Date and time

Time source	Cynap has a built-in battery-buffered RTC clock (Real Time Clock). Settings will only be lost if the battery is empty. To eliminate the risk of incorrect time stamps, Cynap can be synchronized to an external time server. Select external and input a valid IP address of a NTP time server.
-------------	---

2.5. Host name

Host name	The Host name can be changed in the settings under general settings. The host name can be useful for network administrators to see the device name in plain text in the list of clients. Please note, this host name is not automatically listed in the DNS list, and therefore cannot be used in a browser without DNS registration.
-----------	---

2.6. LAN / WLAN port

The LAN port enables integration of Cynap into an internal network. Administrators of a large number of Cynap systems can use the LAN port to control, support and update all of their units from their local desktop PC.

The list of applications for the Cynap LAN port is constantly increasing. It can be used for controlling, capturing still images, viewing live video streams, firmware updates, adjustments, menu settings and for maintenance purposes. Some features are only supported when using vSolution Link software.

The following protocols are supported: TCP/IP, IGMP, RTP, RTSP, UDP and ARP.
Supported (tested) internet browsers are: Internet Explorer, Firefox, Chrome, and Safari.
By default, DHCP is activated to receive all network settings automatically from the server.

Hint - WLAN:

To ensure optimal performance of supplied remote control, prevent channel 13 in the band of 2.4 GHz. Switch Cynap to standby closes all connections.

2.7. FTP Client settings

FTP enable	Enable or disable FTP client functionality to backup and share recorded videos and snapshots. Additional features such as active/passive mode or secure layers (eg. Kerberos etc.) are not supported.
URL	Address of your FTP server in your network, like 192.168.0.100. (up to 256 characters, no space between the characters)
Username	Input the username according your FTP server settings.
Password	Input the password according your FTP server settings.
Test it now	During the test, Cynap will upload a text file onto the FTP-server ("cynap.txt" without content)

2.8. Proxy settings

To increase security level, use a proxy server to control HTTP and HTTPS traffic from Cynap. Built-in access point and other local services are not controlled. To take effect the new settings, Cynap will reboot automatically.

Proxy enable	Enable / disable proxy service When enable, all HTTP and HTTPS traffic will be routed to the your proxy server. Please note, using a Proxy server may block Skype for Business (optional) functionality.
URL	URL of the proxy server in your network, like 104.236.10.17 (or DNS name up to 256 characters, no space between the characters). DNS server not required, when using IP addresses.
Host Port	Port, set the used network port to connect to your proxy server.
Authentication	Disable / enable Authentication When enabled, valid user name and password has to be entered.
Username	Username, given by your server.
Password	Password, given by your server.

2.9. Security

Admin password

Defines the necessary password for administrator access. This login data is needed to change the Ethernet Mode, and an existing administrator password. Using the login data, an administrator can connect to Cynap at any time. The default password is "Password". Remember to make a note of any changed passwords!

Login Security

Accessing Cynap can be protected by authentication (admin, moderator or PIN). To prevent unauthorized access of the settings, the admin password needs to be entered once per session.

Network Security

Accessing Cynap can be limited to secure connections only (https). Please note, the accessing application needs to support SSL / TLS (e.g. the most modern browsers are supporting HTML5 and SSL /TLS).

Wolfvision support access can be prohibited by disabling SSH.

LAN Security

When using wired network, use authentication (according 802.1x) to maximize security.
When using certificates, load it busy using the Web Interface.

WLAN (WiFi) Security

When using wireless network, use encryption to maximize security.
Cynap complies with following standards:

- WEP
- WPA2
- WPA2 Enterprise (according 802.1x)

Hint

WEP allows password with a length of 13 characters.
WPA2 allows password with a length of 8 ~ 63 characters.
Use special characters carefully, not every third party device can handle it.
When using WPA2 Enterprise, load the certificate by using the Web Interface.

Security Settings

To prevent unauthorized changes of the settings through the front display. Additionally the support of USB storage devices can be disabled.

3. Network integration (examples)

The following examples of network integration show the different ways in which Cynap can be integrated. Various operating systems can each connect to Cynap to transfer different information from different sources onto a large monitor.

3.1. Stand-alone access point mode (without network integration)

Cynap is operated in stand-alone access point mode.

The network settings must be set manually on Cynap (no DHCP server is available). Cynap generates an independent WLAN, and WLAN enabled devices (BYOD) can connect to Cynap.

Advantages:

- No complex network infrastructure necessary
- Cynap generates its own stand-alone access point
- No connection to internal IT infrastructure
- Security issues - no other unit from the internal IT infrastructure can access Cynap

Disadvantages:

- No devices have internet access
- Cloud services cannot be used

Required settings:

DHCP	Switch to OFF to enable manual setting of addresses
IP Address	Unique address in the network, like 192.168.0.100. The IP address of a connected PC could be set to 192.168.0.1 for maintenance purposes
Subnet Mask	Available IP addresses can be limited. A commonly used subnet mask would be 255.255.255.0
Gateway	Enter the IP address of a directly connected PC for maintenance purposes
Name server	Not needed

3.2. Cynap wireless network access point mode

Cynap is integrated via a cable connection into an existing network, and is operated in wireless network access point mode. LAN settings for Cynap can be provided by the DHCP server. Cynap generates an independent WLAN, and WLAN enabled devices (BYOD) can connect to Cynap.

Advantages:

- All devices can communicate with each other
- Cynap has access to the Internet and cloud services can be activated
- Cynap can access the internet to check for firmware updates without using additional devices

Disadvantages:

- Performance issues (all traffic is on the same network)

Hint:

If the units are in different subnets, Cynap might not be able to be discovered automatically by vSolution applications.

3.3. Cynap network infrastructure mode

Cynap is integrated via a cable connection into an existing network (e.g. Corporate network), and is operated in network infrastructure mode. LAN settings for Cynap can be provided by the DHCP server. In infrastructure mode, Cynap is connected to an existing wireless access point in the existing network (e.g. Guest network). BYOD devices in the Corporate network and in the Guest network can connect to Cynap.

Advantages:

- All devices can communicate with each other
- Cynap has access to the internet and cloud services can be activated
- Cynap can be moved within the range of the access point
- Cynap can access the internet to check for firmware updates without using additional devices

Disadvantage:

- Performance issues (all traffic is on the same network)

Hint:

If the units are in different subnets, Cynap might not be able to be discovered automatically by vSolution applications.

Cynap can also be installed in a VLAN.

3.4. Cynap connection to a Visualizer

Cynap has a dedicated LAN port for connecting to a Visualizer with built-in DHCP server functionality. Activate on the Visualizer to obtain all necessary network settings from Cynap automatically. Communication between Visualizer and Cynap is over the Wolfprot protocol. The connection between Cynap and the Visualizer is a direct connection (point to point) and shouldn't be made through a switch or similar device.

More information on this protocol can be found on our website in the support section www.wolfvision.com.

Attention:

When the second LAN port is set to Visualizer Mode, never connect this LAN port for the Visualizer to your existing network infrastructure!

If this port is set to Visualizer mode, Cynap acts as DHCP-server on this port and this could cause conflicts with the existing infrastructure.

Hint:

- Connect the Visualizer straight to the dedicated port. Do not add switchers, hubs, routers or similar between Cynap and the Visualizer to prevent error sources.
- Cynap can be controlled with the keys of the Visualizer. The functions of keys from the camera head are dedicated to control Cynap. These keys are not effective to the Visualizer anymore. The IR-remote control of the Visualizer is not effective in this setup.
- Visualizer can be controlled with Cynap.
- Cynap and Wolfvision Visualizer are supporting cable runs up to 100m according Ethernet specification.
- The behavior of this LAN port can be changed to connect Cynap to a dedicated RMS network (Room Management System). This way the built-in DHCP-server is deactivated and a Visualizer cannot be fully integrated.

4. Firewall rules

Cynap has firewall rules that must be adhered to in order to allow successful network communications, and the corresponding services to be used.

Port	Type	Function	Description
21	TCP	FTP	Connection to FTP Server.
22	TCP	SSH	Access for WolfVision support.
80	TCP	http, Cynap control	This port is used to connect to the Cynap web interface (httpd). If this port is blocked, no connection can be made.
8080	TCP / UDP	Proxy	Default port for proxy function (This port can be changed in the Proxy settings).
111 2049	TCP/UDP	NFS	Connection to network drives
123	UDP	NTP	For optional clock synchronization by a time server (Network Time Protocol, NTP)
137 – 139	TCP/UDP	CIFS	Connection to network drives
443	TCP/UDP	https, SSL, e.g. Cloud services, Cynap control	This port is used to cloud services and for secure connect to the Cynap web interface. If this port is blocked, no connection can be made.
554	TCP	RTSP	This the communication port for the RTSP stream. The used UDP port will be handled automatically.
4100	TCP/UDP	Chromecast / Airplay	Audio for Chromecast and Airplay
5353	UDP	Multicast DNS	This port is used to connect Airplay devices to Cynap. If this port is blocked, no connection can be made. (Bonjour)
8800 – 9000	UDP	Multicast/Unicast Streaming	Used for Multicast/Unicast Audio/Video Streaming
10000 – 16000 50000 – 65000	TCP/UDP	WebRTC	Communication Port
50000	UDP	Discovery Multicast	This port is used for device discovery all available Cynap and Visualizer in the network by vSolution applications (uses Multicast IP address 239.255.255.250). If this port is blocked, vSolution applications may not be able to find devices automatically.
50913	UDP	Device Discovery	This port is used for device discovery. If this port is blocked, device discovery is not possible.
50915	TCP	For control purposes	This port is used for control purposes (e.g. room control system, and others). If this port is blocked, no control is possible.
50916	TCP/UDP	Communication WolfVision App Cynap – Visualizer	This port is for communication between WolfVision applications (e.g. vSolution Connect) to Cynap and / or Visualizer. If this port is blocked, communication to Cynap and / or Visualizer, inclusive firmware updates are blocked.

50917	TCP	TLS Control	This port is for secure communication between WolfVision applications (e.g. vSolution Connect) to Cynap and / or Visualizer. If this port is blocked, secure communication to Cynap and / or Visualizer, inclusive firmware updates are blocked.
50921	TCP	Video streams	Video streams between WolfVision App to Cynap and Visualizer. If this port are blocked, no streams are possible.
7681	TCP	WebSocket	User interface communication with Cynap (via browser).
7682	TCP	WebSocket	User interface communication with Cynap (via fully integrated Visualizer).
7000 7100 8008 8009 47000	TCP	Chromecast / Airplay	Communication Chromecast / Airplay

5. Differences in Open Mode / Protected Mode

When using Cynap, it is possible to choose between either open mode or protected mode. This different mode can be selected using Cynap settings.

Modes:

Open Mode

The open is intended for quick and easy connections and BYOD without the need of high security and big effort for administration.

When Open Mode is active, all available devices can connect to Cynap.

In the Open Mode, Airplay PIN can be used to prevent disturbance of extern Apple devices.

The PIN will be shown on the connected display only (HDMI or HDBaseT).

Protected Mode

Is a password protected mode to prevent misuse and disturbances

- Users with knowledge of the password can connect to Cynap
- Users who knowing the security PIN, the PIN will be displayed on the selected interface(s)
- Users can connect when Cynap is awaiting a mirror connection

For more information, please refer to the manual.

6. BYOD

Cynap is designed to make it as easy as possible for users to connect to it. Cynap supports integrated mirroring protocols in its operating system. Users can connect to Cynap without needing any additional software. The mobile platforms are AirPlay for iOS devices and Miracast for Android and Windows devices. Regarding laptop and computer operating systems, AirPlay is also supported for Mac OS X. Windows Intel Wireless Display is also supported, and this integrates natively with Windows 8.1.

AirPlay Support for iOS 5.0 (released 2011) and above, or OS X 10.8 Mountain Lion (released 2012) and above. AirPlay is transmitted via Ethernet / WLAN. It can be used for displaying up to four sources.

vSolution Cast for iOS (App) For use in network environments where the Bonjour service (device discovery protocol) has been disabled.

Miracast Miracast is based on a Wi-Fi direct connection. This means that Miracast can only be used in close proximity to Cynap. Due to the direct communication with a device, only one connection to Cynap is possible at the same time (HDCP will be not supported). When using Microsoft Windows PCs or tablets, the use of vSolution Cast is recommended.

vSolution Cast (Windows) In applications where a Wi-Fi direct connection is not possible due to the installation, multiple Windows devices can be connected at the same time using the alternative vSolution Cast.

vSolution Connect vSolution Connect is a professional presentation tool which offers an alternative to mirroring for Android and iOS. Mirroring has some disadvantages, and can, for example, allow incoming messages or calendar pop-ups to be visible on-screen to all participants during a presentation.

Chromecast Screen Mirroring Support for Chromecast capable devices. Chromecast is transmitted via Ethernet / WLAN. It can be used for displaying up to four sources.

AirPlay, Chromecast, Miracast and vSolution Cast are based on device discovery technologies for maximum ease of use. Therefore it is necessary that the appropriate services (See Firewall rules) are available. Alternatively, when using vSolution Cast, a Cynap IP address can be entered manually. On Windows systems, vSolution Cast can either be run temporarily by users, or permanently installed (copied). The application can also be used from a USB stick without needing administrator rights, however with the restriction that no sound is transmitted.

Switching Cynap to standby closes all connections.

7. Document and media player

Cynap can present almost all commonly used document and video file formats. This functionality is built in to Cynap and no additional applications need to be installed.

Cynap also supports different storage media for presentation of documents and video.

The following storage media are available for Cynap.

- Internal storage
- USB flash drive
- Network Drive
- Cloud services
- Online Office documents with optional Office 365 Feature Pack

The following media formats are supported:

- Supported pictures file formats: GIF, JPEG, BMP, PNG
- Supported video file formats: AVI, WMV, MOV, MP4, DivX, MKV, M4V, OGV
- Supported document file formats: PDF, Word, PowerPoint, Excel
- Supported audio file formats: MP3, MKA, OGA, OGG, WMA

8. Streaming RTP / RTSP

Cynap has a built-in streaming server which is capable of broadcasting audio and video content over the network for RTP or RTSP Streaming.

Prepare Ethernet connection (wired or wireless) and select the setting on Cynap. In the settings, you can assign the IP address of the destination (for RTP multicast select: 225.0.0.0 to 238.255.255.255, with all other addresses the RTP Unicast stream can be received at the entered destination only, 224.x.x.x and 239.x.x.x are reserved), port, resolution, frame rate and format of the stream (up to RTP H.264). Select the settings for resolution, frame rate and format. Cynap broadcasts the currently shown content of video and audio files to the network. For RTP, all necessary settings will be provided to the player / browser in a file. RTSP Streaming is a Unicast stream, an end-to-end connection between server and clients and all settings be handled automatically.

The respective link will be shown below the QR-code by using "Link To Stream" in the toolbox.

- RTP stream: e.g.: <http://192.168.0.100/stream.sdp> (exchange the example address with the IP address of your Cynap).
- RTSP stream: e.g.: <rtsp://192.168.0.100/stream> (exchange the example address with the IP address of your Cynap).

Streaming settings

Enable / Disable Streaming	When disabled, the Streaming button will be not displayed in the toolbox and will be not available with Media Cast key).
Resolution	Resolution of the network stream, up to 1080p (note resulting network traffic)
Frame Rate	Frame rate, higher frame rate results in more network traffic (LOW=10, MEDIUM=20, HIGH=30).
Dynamic QR-Code	Enable / Disable Dynamic QR-Code to allow random URLs to receive the stream (QR-Code and URL changes with every new presentation).

RTP Stream enable	Enable / Disable RTP Stream (RTSP cannot be simultaneously)
Interface	Select the desired interface where the stream has to be sent, wired (LAN) or wireless (WLAN). When using multicast, the LAN port has to be selected. This setting is available for RTP only.
Time to Live	To specify how many hops (routers) the packet can elapse before the data will be discarded. This setting is available for RTP only.
IP Address	IP address for UDP stream, 225.x.x.x to 238.255.255.255 are valid multicast addresses. To use unicast, enter the destination IP address (IP address of the receiving device). This setting is available for RTP only.
Port	Where the stream will be sent over the network (range 8800 – 9000, even numbers allowed only). The used audio port will be displayed for information, it cannot be changed separately (it is always 2 ports higher). This setting is available for RTP only.
RTSP Stream enable	Enable / Disable RTSP Streaming (RTP cannot be used simultaneously). Cynap is sending several UDP streams (Unicast streams) according the number of connected clients. This way, also several clients connected to built-in access point and at the same time over the LAN interface, can receive the stream. All settings will be handled automatically.
Display QR-Code Interface	Select the desired interface and the respective link will be shown, wired (LAN) or wireless (WLAN). Use “Link To Stream” form the Toolbox to show the link to your partners. The stream itself will be sent to both interfaces. This setting is available for RTSP only and can be set in the general settings.

Streaming bandwidth:

Overview of Streaming bandwidth in relation to resolution.

Resolution	Mbit/s
360p	4
540p	6
720p	8,5
1080p	14

How to get the Stream

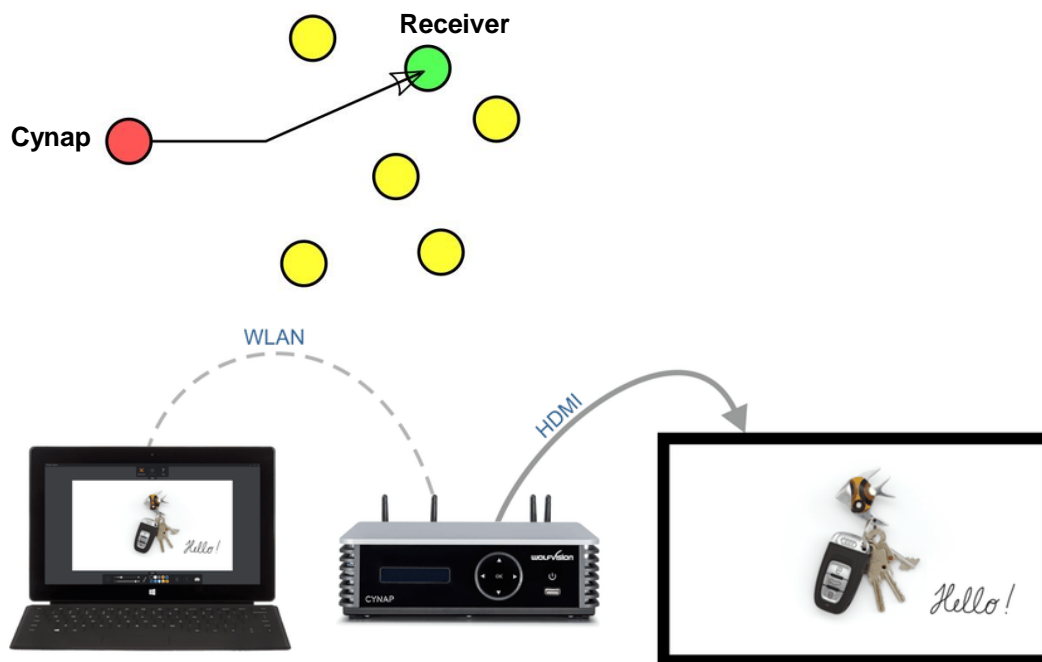

Open the Toolbox, select Start Streaming and use the button “Link to Stream” to show the QR code to easily access the stream e.g. when using vSolution Capture.

When using RTSP, the stream will be sent to both interfaces, but the QR code will show just the selected interface (LAN or WLAN).

8.1. Unicast Streaming

Cynap's sending stream to a single receiver. That's a one to one connection. The IP address the unique listening receiver can be adjusted in the streaming settings.

When using RTSP, more than one client would be able to watch the stream over LAN and WLAN simultaneously. Cynap will start a separate unicast stream to each client according of connected clients. The settings will be handled automatically between server and client.

Hint:

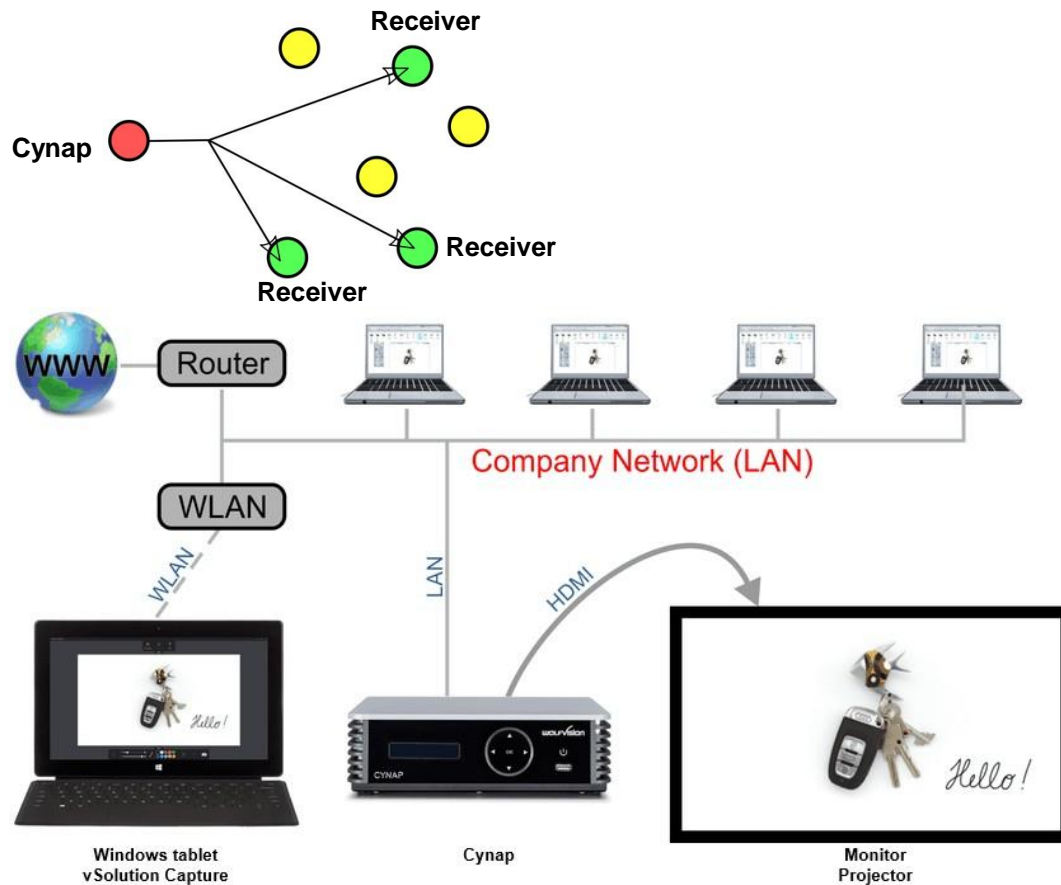

Cynap in Access point mode, UDP-streams over WLAN are limited to Unicast. Multicast not supported on Cynap Access point.

8.2. Multicast Streaming

Cynap's sending stream to a Multicast group. That's a one to many connection. The IP address of the Multicast group can be adjusted in the streaming settings.

Multicast stream is being sent over LAN interface only.

Note: 224.x.x.x and 239.x.x.x are reserved IP areas and should not be used.

Important:

Activate IGMP snooping.

Normally (without IGMP snooping) a switch will forward a multicast frame to all switch port (except incoming port). IGMP snooping allows the switch to send multicast frames only to those receivers that join a particular group by listening leave messages from the hosts.

Please note:

The more clients are connected the more the network could be stressed. The maximum number of connected clients mainly depends on the local infrastructure.

Not every device (client) is supporting Multicast, use RTSP instead.

Switching Cynap to standby or ending the presentation closes all connections and stops streaming.

9. Streaming with enable Webcasting Feature Pack

The Webcasting function allows uploading live streams onto live view and on-demand service providers. Audiences of any size can watch the recorded video anytime, from any location. This way, your local network will be less stressed.

Available services / mode are:

- IBM Cloud Video (Ustream) Live Streaming
- Wowza Streaming
- YouTube Live
- Custom (e.g. to share content on Facebook)

9.1. IBM Cloud Video (Ustream) Live Streaming

Webcast enable	Enable / Disable Webcast functionality
Mode	Choose the IBM Cloud Video (Ustream) Live Streaming
Username	Input the username given by the selected service provider
Password	Input the password given by the selected service provider
Channel	Select the already prepared channel (available when successfully logged in)

9.2. Wowza Streaming

Webcast enable	Enable / Disable Webcast functionality
Mode	Choose the Wowza Streaming
Host Server	Defines the address of the Wowza Server
Host Port	Defines the Port of the Wowza Server
Application	Defines the Application of the Wowza Server
Input Name	Defines the Input Name
Publisher Name	Defines the Publisher Name of the Wozwa Server
Publisher Password	Defines the Publisher Password of the Wozwa Server

9.3. YouTube Live

Webcast enable	Enable / Disable Webcast functionality
Mode	Choose the YouTube Live
Login	Login to the Google Account

9.4. Custom (e.g. to share content to Facebook)

Webcast enable	Enable / Disable Webcast functionality
Mode	Choose the Custom
URL	Input the URL according recommendations of your RTMP capable provider, e.g. Facebook

10. Network Stream (input)

Cynap has a built-in streaming client which is capable of receiving broadcast video content over the network.

Up to four Stream sources can be defined and individually named in the GUI settings (Input).

Add new Input Stream	Allows adding up to four network streams selectable as source (click the + symbol).
Input name	Gives the source an individual name for easy identification
Input mode	Defines the kind of stream. <ul style="list-style-type: none"> • None, disables receiving this stream • Generic allows streams using UDP and TCP protocol • RTSP / RTP over TCP allows TCP protocol only
Input URL	Record Stream Input URL defines the source of the stream

Example:

Network stream input with two devices, one from Cynap Meeting Room 2 and one from IP Camera.

At the Cynap Meeting Room 1 are two network stream input configured with the following settings.

The screenshot shows the 'INPUT' configuration screen in the WOLFVISION interface. At the top, there is a navigation bar with a back arrow, 'Settings', the title 'INPUT', a 'Disconnect' button, and a close 'X' button. Below this, a 'STREAM' section contains an 'Add new Input Stream' button with a plus icon. The main area lists two configured inputs. Each input has an 'INPUT NAME' field, an 'INPUT MODE' dropdown menu, and an 'INPUT URL' field. The first input is named 'Cynap Meeting Room 2' with 'Generic' mode and URL 'rtsp://10.0.6.7/stream'. The second input is named 'IP Camera' with 'Generic' mode and URL 'rtsp://10.0.3.80/mpeg4/media.amp'.

INPUT NAME	INPUT MODE	INPUT URL
Cynap Meeting Room 2	Generic	rtsp://10.0.6.7/stream
IP Camera	Generic	rtsp://10.0.3.80/mpeg4/media.amp

After saving configuration the new two sources (IP Camera, Cynap Meeting Room 2) are available.

At the Cynap Meeting Room 2 the RTSP Stream is enabled and Streaming must be started. Then choose the sources IP Camera and Cynap Meeting Room 2 and then contents will be displayed Cynap Meeting Room 1.

11. Control of Peripheral Devices

Cynap is able to send up to 10 commands to connected network devices, e.g. to fully power up the connected projector. This feature will be triggered by power events of Cynap. The peripheral devices, like projectors, monitor, lightings, windows shades, etc. need to be in the same network as Cynap.

Command enable	Enable / disable certain commands (entered command settings will be not deleted)
Name	To give the command an individual name (like "projector")
Description	To give the command a detailed description (like "power up")
Event	To define at which power state of Cynap the command will be sent (Power ON or Power OFF). Select event None to delete this entry.
Protocol	Defines the used network protocol (TCP or UDP)
IP address	Defines the destination, enter the address of the third party device
Port	Defines at which network port the command will be sent (note documentation of the third party device and firewall settings)
Hex Command	Enter the command according documentation of the third party device.

12. Recording

Cynap has a recording function to record presentations. All types of content can be stored internally. The resolution of recordings can be adjusted in the settings. Supported video file format is MP4-container with codec H.264 (video file extension is *.mp4).

Streaming settings

Resolution Defines the resolution of the system (360, 540, 720p, 1080p).
Frame rate Defines the max. frame rate (refresh rate) of the sent stream (LOW=10, MEDIUM=20, HIGH=30).

Example:

Video	Power Point
Source: Big Buck Bunny 1080p (file size 885 MB)	Source: Presentation with text and a few graphics, 60 pages (file size 863 KB)
Settings: Resolution 720p30	Settings: Resolution 720p30
Recording: For one hour	Recording: For one hour
Result: File size recording 1,43 GB	Result: File size recording 596 MB

Please note:

Switching Cynap to standby stops recording and deletes file from system folder.

13. Recording with enabled Capture Feature Pack

With enabled Capture Feature Pack, additional settings are available and Cynap's recording functionality can be controlled remotely by Opencast server.

Additionally Cynap is able to record the network stream of an external camera as second file in the background. To record huge amount of sessions, a USB storage device can be used instead of the internal SSD.

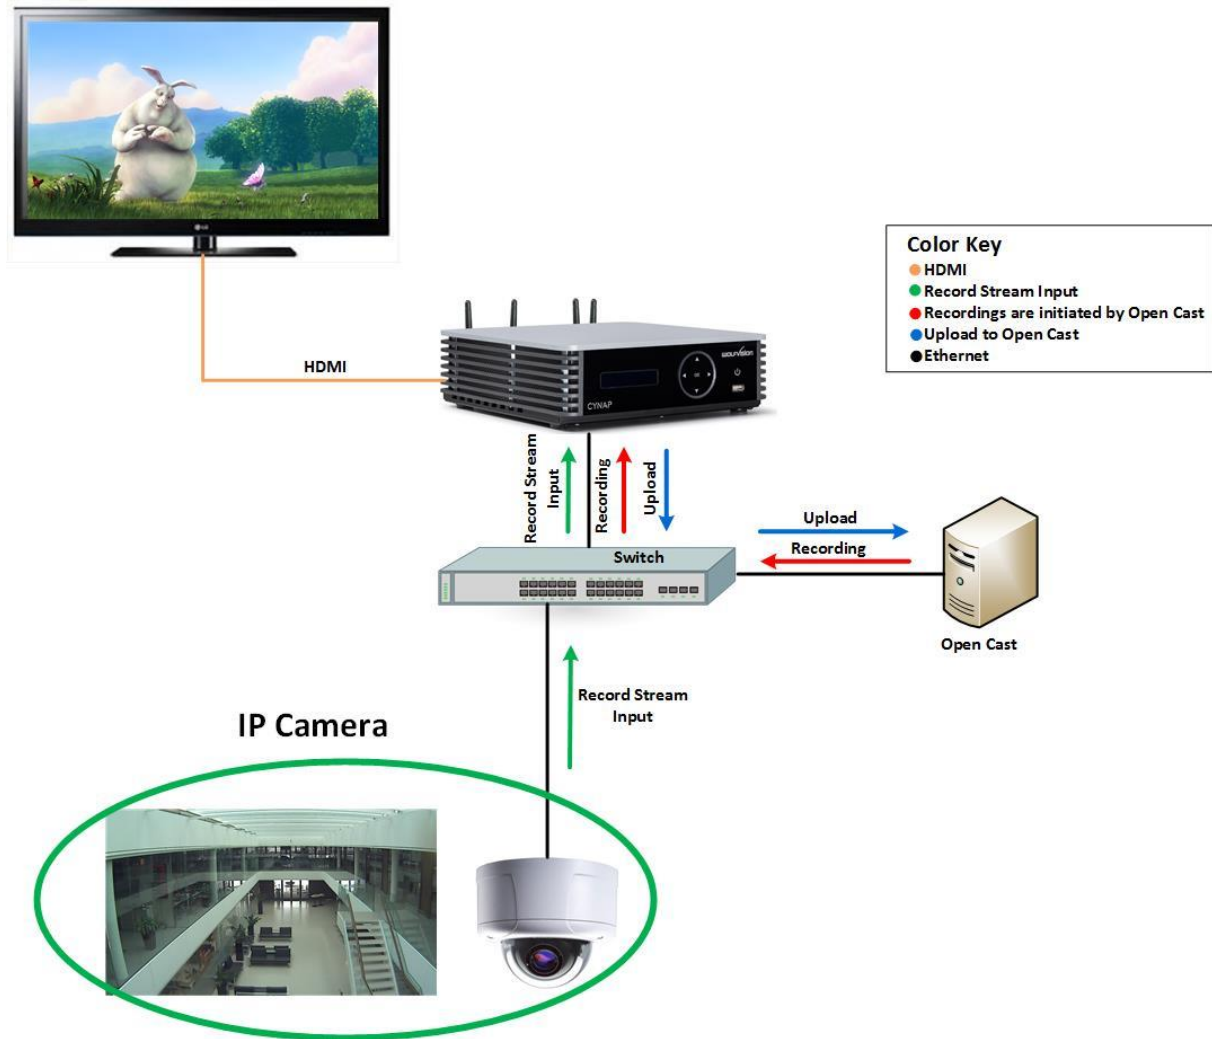

The current state will be indicated, available states are: disabled, idle, recording or fail.

Additional settings are:

Capture agent	Enable / Disable Capture Agent - Standby function of Cynap is blocked when the Capture Agent is enabled - When a server controlled task is running, local recording through the Toolbox is blocked
Capture Agent Name	Allows identification at the Opencast server
Recording Path	Allows recording onto a connected USB storage device
URL	Defines the address of the Opencast server
Username / Password	Are required by the Opencast server (credentials required at the server)
Ingest Time Mode	Select AUTO and all recordings are initiated by the Opencast server. Select MANUAL and set the desired starting time.
Time	Allows starting recording at the desired time. This field is available in manual ingest mode only.
Root Certificate	This allows connecting to a Root Certificate (CA) protected server. To load the certificate, click the Browse button and select the respective file in the explorer windows (Base-64-coded X.509). The certificates cannot be loaded when using the local GUI (on HDMI).
Record Stream Input	Allows adding external network stream which will be saved as separate video file. - None, disables receiving any stream - Generic allows streams using UDP and TCP protocol - RTSP / RTP over TCP allows TCP protocol only
Record Stream Input URL	Defines the source of the stream.
Record Stream Input Audio	Allows adding the audio content from the stream to the recording.
Test Stream Input	Cynap will open a new window to show the stream local.
External Storage	Indicates the state.
Storage Action	Allows mounting and formatting the external drive. The drive has to be mounted before it can be used. Formatting will delete all content from the USB storage device! Use file format is EXT4.
Execute Action (Button)	Changes for the external drive will take effect. During initialization, the state is changing to busy.

Example:

Cynap has a connection to Opencast Server. Ingest time Mode is AUTO and all recordings are initiated by the Opencast Server. The IP Camera (Record Stream Input), will be also initiated by the Opencast Server. The Record Stream Input will not be displayed at the HDMI Out. After recordings from the Capture Agent, they are automatically uploaded to Opencast Server. Recording files will not be deleted after uploading to the Opencast Server on the Cynap but remain as a backup on the internal or external storage. The successfully completed events (recordings & upload) are stored in a ring memory, which is deleted in succession, starting with the oldest recording, if the storage space is too low.

14. Cloud services

Cynap supports Google Drive, Dropbox, Box, Jianguoyun, OneDrive and WebDAV cloud services. These services can be enabled or disabled in the settings. For specific firewall settings, check the individual service provider.

15. Network Drive

Cynap allows direct access to network drives (writeable or read-only). A default drive can be specified to simplify the upload functionality of a recording or snapshot.

Up to 10 network drives can be configured in the network drive settings.

CIFS and NFSv3 file systems are supported.

16. User interface

You can adjust Cynap basic settings using the function keys on the front of the device. Cynap can be controlled using any current standard browser. The user interface has been developed using the latest web programming standards, and this means that there is no need for additional add-ons or plugins such as the Java Platform, in order to have full control of Cynap. HTML5 technology only requires a browser that can handle JavaScript and Websockets, and this has been state-of-the-art for the last few years. You can also adjust the settings using the remote control. The remote control uses the 2.4 GHz band. The remote control has a built-in gyro sensor and can be used as a digital laser pointer. Cynap can also be used in combination with room management systems. Communication is possible via the Wolfprot protocol. More information about this protocol can be found in the support section of our website www.wolfvision.com.

The vSolution Control app allows smartphones / tablets (iOS, Windows, Android) to control Cynap directly via WLAN. More information about the vSolution Control App can be found on in the support section of our website www.wolfvision.com.

17. Hardware and OS

Cynap uses a Linux operating system. The distribution is a WolfVision specific variant, which in addition to the Linux kernel contains only the individual libraries and packages required for the functionality of Cynap. This operating system is efficient, secure and lean. The operating system is installed after the installation process, and every update is installed to a read-only partition that cannot be changed after the installation process. This feature and the strict separation of system and user data, such as pictures, videos etc. ensures a very high level of system security. The system structure is protected against any external access, and it does not require additional security programs (antivirus, firewall, etc.). The Cynap system includes all viewer and software packages, and no additional licenses are required.

The current hardware specifications, connectors, delivery, and technical specifications can be found on our website www.wolfvision.com.

A 19" rack mount is available as an optional accessory if required for installing Cynap (2HE).

18. Administration

Cynap can be managed using the vSolution Link software.

With vSolution Link software, administration tasks can be performed for multiple Cynap systems. With this admin tool, you can perform central firmware upgrades as well as determining the state of Cynap and Wake-on-LAN (WoL). You can also create, manage, and distribute a settings profile to all Cynap systems using vSolution Link software.

More information about vSolution Link software can be found in the support section of our website www.wolfvision.com.

19. Bandwidth Measurement Data

This bandwidth measurement data has been taken using a notebook PC with a Windows operating system. The computer was connected to Cynap via WLAN, and was operating in network infrastructure mode.

19.1. Multimedia streaming (Multicast)

1080p video (Big Buck Bunny) is displayed on the Cynap and streamed to the notebook using vSolution Capture Software to a single connected client. (Traffic In)

19.2. PowerPoint Presentation

Presentation with text and a few graphics are displayed from the notebook and are mirrored to Cynap using vSolution Cast Software to a single connected client. (Traffic Out)

19.3. Multimedia from Notebook to Cynap using vCast Software

1080p video (Big Buck Bunny) is displayed on the notebook and is mirrored using the vSolution Cast Software to a single connected client. (Traffic Out)

20. Client System Requirements

Requirement Airplay Mirroring OS X Mountain Lion v10.8 (Release 2012) or later:

Product	Version
iMac	Mid 2011 or later
Mac mini	Mid 2011 or later
MacBook Air	Mid 2011 or later
MacBook Pro	Early 2011 or later
Mac Pro	Late 2013 or later

Requirement Airplay Mirroring iOS 5.0 (Release 2011) or later:

Product	Version
iPhone	4 or later
iPad	2 or later
iPad	mini or later
iPod touch	5 th generation or later

Requirement Miracast:

Product	Version
Android	4.4.2 or later
Microsoft Windows	8.1, 10 Hardware with Miracast support required
Windows Phone	8.1, 10
Blackberry	10.2.1 or later

Requirement Chromecast:

Product	Version
Android	4.0.3 or later (Chromecast required)
Microsoft Windows	7, 8.1, 10 (Chromecast Browser Plugin required)

21. Index

Version	Date	Changes
1.0	04.05.2015	Created
	05.05.2015	Minor text edits
1.1	16.07.2015	- Change images page 4 / 5 / 6 / 7 / 8 / 9, 2 antennas to 4 antennas - Page 10, Port 50921, 50916 added
1.2	13.08.2015	- Addition to recording, video and power point example (file size) - Client system requirements, added point 15
1.3	02.10.2015	Minor text edit
1.4	04.11.2015	- Minor text edits - 2.8 FTP Client settings added - 3.6 Cynap connection to Visualizer added (Attention, Hint) - 5 Meeting Mode / Lecture Mode change in Open Mode / Protected Mode
1.5	03.02.2016	- Minor text edits - 2.3 WLAN settings – access point, removed WEP, WPA Enterprise encryption
1.6	20.06.2016	- Minor text edits - 3.4 Cynap VLAN wireless network access point mode delete (obsolete) - 3.5 Cynap VLAN wireless network infrastructure mode delete (obsolete) - 4 Addition Firewall rules - 6 Addition BYOD, vSolution Cast for iOS, Chromecast - 8 Addition Streaming bandwidth - 8.1 Addition Unicast Streaming - 8.2 Addition Multicast Streaming - 11 Addition network drive - 16 Addition Requirement Chromecast
1.7	06.09.2016	- Minor text edits - 2.1 Addition authentication LAN / Ethernet - 2.4 Addition authentication WLAN settings – infrastructure
1.8	18.11.2016	- Minor text edits - 2.1 LAN / Ethernet settings - Priority Interfaces Access added - 2.4 WLAN settings- infrastructure – Priority Interfaces Access added - 2.8 Addition FTP Client settings - 4 Addition Firewall rules - 8 Addition Streaming RTP /RTSP - 10 Cloud Services – Box cloud service added - 11 Addition Network Drive

1.9	03.02.2017	<ul style="list-style-type: none">- Minor text edits- Added Ethernet functionality to second LAN port- Illustrations updated- Added support for network stream sources- Added peripheral control functionality- Added recording with enabled Capture Feature Pack- Addition WLAN SSID - Following characters are supported
1.10	18.04.2017	<ul style="list-style-type: none">- Minor text edits- Added cloud service Jianguoyun- Added WLAN settings, BSSID and band selection, and extended Access Point list- Renamed Google Cast to Chromecast
1.11	11.11.2017	<ul style="list-style-type: none">- Minor text edits- Added WLAN settings, Signal Level Limit (dBm), Signal Level, Reconnect Counter (Connection Loss), Reconnect Counter (Low Signal Level)- Added Proxy settings- Added Streaming with enable Webcasting Feature Pack- Added Cloud service OneDrive, WebDAV
